MENIERE'S DISEASE

Meniere's disease was first described over 100 years ago. Since then we have learned a lot about the process. We now know that Meniere's is a disease of fluid pressure build up in the inner ear. There are no causative factors and it comes and goes intermittently. It usually affects one ear, but rarely can affect both.

Symptoms:

Meniere's disease usually starts with a sudden attack of severe whirling vertigo. It is commonly associated with a roaring tinnitus (head noise), hearing loss and pressure sensation in the ear. The attacks come suddenly and are unpredictable and last for several hours to days. It can lead to severe hearing loss and imbalance but is often much milder with some individuals only having one or two attacks in a life time.

Pathophysiology:

Theory tells us that as the pressure builds up in the endolymphatic system the membranes first stretch and then finally rupture. That is when the sudden attack happens. If the site of the rupture is in the cochlea (the hearing organ of the inner ear) one might only have hearing loss and tinnitus with no vertigo. Rarer is Vestibular Meniere's in which the rupture is in the Vestibular system and the individual only has vertigo with no hearing loss. Usually it is a combination of hearing loss and vertigo.

Treatment:

Acute Attack: Medication such as meclizine (Antivert), Valium, Scopolamine, ect. (meclizine is over the counter but has potential sedative side effects.)

Medical Therapy:

1. No added salt (sodium) diet- 1.5 gram (Na Diet)
2. Fluid pills such as HCTZ, Acetazolamide, Dyazide
3. Control of allergies
4. Avoid caffeine, tobacco, and alcohol

Northwest Office

7040 Smoke Ranch Road
Las Vegas, NV 89128

Green Valley Office

3195 St Rose Parkway
Suite 210
Henderson, NV 89052
(Mailing address)

Southwest Office

8840 W Sunset Road
Suite A
Las Vegas, NV 89148

EAR, NOSE & THROAT CONSULTANTS OF NEVADA

Surgical Therapy:

1. Gentamycin Installation into the middle ear or Meuiette device via tube in ear
2. Endolymphatic Sac decompression or shunt
3. Vestibular Nerve Section
4. Labarynthectomy (destruction of the inner ear)

Surgical therapy is aimed at controlling the vertigo and does not help the hearing.

No Salt Added Diet (1.5 gram sodium)

1. Cook with no salt.
2. Add no salt at the table
3. Avoid foods with visible salt such as potato chips, crackers, French fries, pretzels, and fast food.
4. Avoid the “Luncheon Meats” cured with sodium nitrate-salami, bologna, bacon, ham, hot dogs, and sausage.
5. Watch out for “Sauces” such as soy sauce, ketchup, barbecue sauce, marinades, etc.
6. Pre-pared food often contains MSG or monosodium glutamate. Make sure that food is prepared with no salt or MSG.
7. Chinese food often contains MSG or monosodium glutamate. Make sure that food is prepared with no salt or MSG.
8. When in a restaurant, tell your waiter that you are on a no salt diet. He/She can advise you what is safe. Also, do not order food with sauce or gravy, and avoid “made dishes”.
